1-HETEROCYCLYL-1,5-DIHYDRO-PYRAZOLO[3,4-D] PYRIMIDIN-4-ONE DERIVATIVES AND THEIR USE AS PDE9A MODULATORS

The invention relates to novel 1,6-disubstituted pyrazolopyrimidinones, wherein i.) the nitrogen atom of the pyrazolo-group that is next to the pyrimidino-group is attached to a non-aromatic, organic heterocycle having at least one ring hetero atom selected from O, N and S and ii.) to the C-atom between the two nitrogen atoms of the pyrimidinone-ring a second substituent is bound via an optionally substituted methylene-bridge. According to one aspect of the invention the new compounds are for the manufacture of medicaments, in particular medicaments for the treatment of conditions concerning deficits in perception, concentration, learning or memory. The new compounds are also for the manufacture of medicaments for the treatment of Alzheimer's disease. Further aspects of the present invention refer to a process for the manufacture of the compounds and their use for producing medicaments.

#### **BACKGROUND OF THE INVENTION**

5

10

- The inhibition of phosphodiesterase 9A (PDE9A) is one of the currents concepts to find new access paths to the treatment of cognitive impairments due to CNS disorders like Alzheimer's Disease or due to any other neurodegenerative process of the brain. With the present invention, new compounds are presented that follow this concept.
- 20 Phosphodiesterase 9A is one member of the wide family of phosphodiesterases.

  These kinds of enzymes modulate the levels of the cyclic nucleotides 5'-3' cyclic adenosine monophosphate (cAMP) and 5'-3' cyclic guanosine monophosphate (cGMP). These cyclic nucleotides (cAMP and cGMP) are important second messengers and therefore play a central role in cellular signal transduction cascades.
- Each of them reactivates inter alia, but not exclusively, protein kinases. The protein kinase activated by cAMP is called protein kinase A (PKA), and the protein kinase activated by cGMP is called protein kinase G (PKG). Activated PKA and PKG are able in turn to phosphorylate a number of cellular effector proteins (e.g. ion channels, G-protein-coupled receptors, structural proteins, transcription factors). It is possible in this way for the second messengers cAMP and cGMP to control a wide variety of

physiological processes in a wide variety of organs. However, the cyclic nucleotides

WO 2009/121919 PCT/EP2009/053907

are also able to act directly on effector molecules. Thus, it is known, for example, that cGMP is able to act directly on ion channels and thus is able to influence the cellular ion concentration (review in: Wei *et al.*, *Prog. Neurobiol.*, **1998**, *56*, 37-64). The phosphodiesterases (PDE) are a control mechanism for controlling the activity of cAMP and cGMP and thus in turn for the corresponding physiological processes. PDEs hydrolyse the cyclic monophosphates to the inactive monophosphates AMP and GMP. Currently, 11 PDE families have been defined on the basis of the sequence homology of the corresponding genes. Individual PDE genes within a family are differentiated by letters (e.g. PDE1A and PDE1B). If different splice variants within a gene also occur, this is then indicated by an additional numbering after the letters (e.g. PDE1A1).

Human PDE9A was cloned and sequenced in 1998. The amino acid identity with other PDEs does not exceed 34 % (PDE8A) and is never less than 28 % (PDE5A). With a Michaelis-Menten constant (Km) of 170 nanomolar, PDE9A has high affinity for cGMP. In addition, PDE9A is selective for cGMP (Km for cAMP=230 micromolar). PDE9A has no cGMP binding domain, suggesting that the enzyme activity is not regulated by cGMP. It was shown in a Western blot analysis that PDE9A is expressed in humans inter alia in testes, brain, small intestine, skeletal muscle, heart, lung, thymus and spleen. The highest expression was found in the brain, small intestine, kidney, prostate, colon, and spleen (Fisher et al., J. Biol. Chem., 1998, 273 (25), 15559-15564; Wang et al., Gene, 2003, 314, 15-27). The gene for human PDE9A is located on chromosome 21q22.3 and comprises 21 exons. 4 alternative splice variants of PDE9A have been identified (Guipponi et al., Hum. Genet., 1998, 103, 386-392). Classical PDE inhibitors do not inhibit human PDE9A. Thus, IBMX, dipyridamole, SKF94120, rolipram and vinpocetine show no inhibition on the isolated enzyme in concentrations of up to 100 micromolar. An IC<sub>50</sub> of 35 micromolar has been demonstrated for zaprinast (Fisher et al., J. Biol. Chem., 1998, 273 (25), 15559-15564).

25

Murine PDE9A was cloned and sequenced in 1998 by Soderling *et al.* (*J. Biol. Chem.*, **1998**, *273* (19), 15553-15558). This has, like the human form, high affinity for cGMP with a Km of 70 nanomolar. Particularly high expression was found in the

## WO 2009/121919 PCT/EP2009/053907

mouse kidney, brain, lung and liver. Murine PDE9A is not inhibited by IBMX in concentrations below 200 micromolar either; the IC<sub>50</sub> for zaprinast is 29 micromolar (Soderling et al., J. Biol. Chem., 1998, 273 (19), 15553-15558). It has been found that PDE9A is strongly expressed in some regions of the rat brain. These include olfactory bulb, hippocampus, cortex, basal ganglia and basal forebrain (Andreeva et al., J. Neurosci., 2001, 21 (22), 9068-9076). The hippocampus, cortex and basal forebrain in particular play an important role in learning and memory processes. As already mentioned above, PDE9A is distinguished by having particularly high affinity for cGMP. PDE9A is therefore active even at low physiological concentrations, in contrast to PDE2A (Km=10 micromolar; Martins et al., J. Biol. Chem., 1982, 257, 1973-1979), PDE5A (Km=4 micromolar; Francis et al., J. Biol. Chem., 1980, 255, 620-626), PDE6A (Km=17 micromolar; Gillespie and Beavo, J. Biol. Chem., 1988, 263 (17), 8133-8141) and PDE11A (Km=0.52 micromolar; Fawcett et al., Proc. Nat. Acad. Sci., 2000, 97 (7), 3702-3707). In contrast to PDE2A (Murashima et al., Biochemistry, 1990, 29, 5285-5292), the catalytic activity of PDE9A is not increased by cGMP because it has no GAF domain (cGMP-binding domain via which the PDE activity is allosterically increased) (Beavo et al., Current Opinion in Cell Biology, 2000, 12, 174-179). PDE9A inhibitors may therefore lead to an increase in the baseline cGMP concentration.

This outline will make it evident that PDE9A engages into specific physiological processes in a characteristic and unique manner, which distinguish the role of PDE9A characteristically from any of the other PDE family members.

WO04099210 discloses 6-arylmethyl-substituted pyrazolopyrimidinones which are PDE9 inhibitors. The compounds do not have a non-aromatic heterocyclic moiety in the 1 position of the pyrazolopyrimidine.

WO04096811 discloses heterocyclic bicycles as PDE9 inhibitors for the treatment of diabetes, including type 1 and type 2 diabetes, hyperglycemia, dyslipidemia, impaired glucose tolerance, metabolic syndrome, and/or cardiovascular disease.

Other prior art is directed to chemically similar nucleoside derivatives. As examples it is referred to WO02057425, which discloses nucleosides derivatives, which are inhibitors of RNA-dependent RNA viral polymerase, or WO01060315, which discloses nucleoside derivatives for the treatment of hepatitis C infection or

EP679657, which discloses compounds that serve as ribonucleoside analogues or US2002058635, which discloses purine L-nucleoside compounds, in which both the purine rings and the sugar are either modified, functionalized, or both. So the sugar for example must show at least one esterified OH group.

WO06084281 discloses inhibitors of the E1 acitvation enzyme that have a sulfonamid moiety.

WO05051944 discloses oxetane-containing nucleosides, for the treatment of nucleoside analogue related disorders such as disorders involving cellular proliferation and infection.

15 GB937726 describe pyrazolopyrimidinones which have a coronary-dilating effect and which can be employed for the treatment of disturbances of myocardial blood flow. US3732225 describes pyrazolopyrimidinones which have an anti-inflammatory and blood glucose-lowering effect.

DE2408906 describes styrylpyrazolopyrimidinones which can be employed as antimicrobial and anti-inflammatory agents for the treatment of, for example, oedema.

#### **OBJECTIVE OF THE INVENTION**

The above cited prior art makes it evident that changes in the substitution pattern of pyrazolopyrimidinones result in interesting changes concerning biological activity, respectively changes in the affinity towards different target enzymes.

Therefore it is an objective of the present invention to provide compounds that effectively modulate PDE9A for the purpose of the development of a medicament, in particular in view of diseases, the treatment of which is accessible via PDE9A modulation.

It is another objective of the present invention to provide compounds that are useful for the manufacture of a medicament for the treatment of CNS disorders.

Yet another objective of the present invention is to provide compounds which show a better side effect profile compared to the compounds of the prior art.

Another objective of the present invention is to provide compounds that have a favourable selectively profile in favour for PDE9A inhibition over other PDE family members and by this may provide advantage over the prior art compounds.

Yet another objective is to provide such a medicament not only for treatment but also for prevention or modification of the corresponding disease.

 $\mathbf{x}$  = 0, 1, 2, 3 or 4, preferably x = 0, 1 or 2, more preferably x = 0, 1 and more preferably x = 0; if not specified otherwise in the context;

y = 0, or 1, preferably y = 0, if not specified otherwise in the context;

with the proviso for each applicable embodiment of formula I of the invention - such as for example embodiments that comprise  $\underline{Hc}^1$  and  $\underline{Hc}^3$  - that

if <u>Hc</u> is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>- spacer.

15 The values of x and y are independent from each other.

The index symbols i, j, k, ł, m, n in  $R^{1,j}$ ,  $R^{2,k}$  etc. are indices, each of which shall have the meaning of an integer figure: 1, 2, 3, etc. so that each  $R^{1,j}$ ,  $R^{2,k}$  etc. represents a characterised, individual embodiment of the corresponding substituents for which  $R^{1,j}$ ,  $R^{2,k}$  etc. are the definitions.

So given the above definitions, a generic genius of compounds according to formula I is fully characterised by the term ( $\underline{Hc}^i R^{1.j} R^{2.k} R^{3.t} R^{4/5.m} R^{10.n}$ ) if for each letter i, j, k,  $\underline{t}$ , m and n an individual figure is given whereby – if not indicated otherwise in a specific context - for each such embodiment ( $\underline{Hc}^i R^{1.j} R^{2.k} R^{3.t} R^{4/5.m} R^{10.n}$ )  $\mathbf{x}$  shall be 0, 1, 2, 3 or 4, preferably  $\mathbf{x} = 0$ , 1 or 2 and  $\mathbf{y}$  shall be 0 or 1 and with the proviso for each applicable embodiment of formula I of the invention that if  $\underline{Hc}$  is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>- group.

WO 2009/121919 PCT/EP2009/053907 - 29 -

In other words, each embodiment (<u>Hc</u><sup>i</sup> R<sup>1,j</sup> R<sup>2,k</sup> R<sup>3,ł</sup> R<sup>4/5,m</sup> R<sup>10,n</sup>) represents a fully characterised genius or subset genius according to the general formula I, i.e. a generic genius of compounds that is subject of the present invention.

Such embodiment defines the variables <u>Hc</u>, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup>, R<sup>5</sup> and if applicable R<sup>10</sup> of formula I and wherein – if not in a specific context indicated otherwise - **x** shall be 0, 1, 2, 3 or 4, preferably being 0, 1 or 2 and **y** shall be 0 or 1 and with the proviso for each applicable embodiment of formula I of the invention that if <u>Hc</u> is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>- group.

In a **1st general aspect** of the present invention, the compound or compounds of the present invention is (are) defined by the following embodiment according to the general formula I characterised by

15 
$$Hc^{1}R^{1.0.1}R^{2.0.1}R^{3.1}R^{4/5.1}R^{10.0.1}$$

with the proviso that

if  $\underline{\textit{Hc}}$  is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>-spacer.

According to the above, this means that the 1st aspect of the present invention is related to compounds according to general formula I

A **specific aspect** of the inventions (18<sup>th</sup> **aspect**) concerns - independently of each other and separable therefrom - each of the following compounds and/or wherever applicable each specific stereoisomer thereof and/or tautomer thereof and/or a pharmaceutically acceptable salt thereof. Each compound is represented and considered in form of the neutral compound without indicating the stereochemistry thereof if any. The left hand column indicates the example the compound derives from. Specific information concerning stereochemical properties can be taken from the experimental section, section **Exemplary embodiments**. In case the final compounds according to said section **Exemplary embodiments** are salts forms,

they can be converted into the neutral compound (free base or acid) by conventional methods.

These 18 main aspects of the inventions, subgroups thereof and some further other aspects of the invention are listed as elements of the following matrix 0 and matrix I which make reference to the notation ( $\underline{Hc}^{i} R^{1.j} R^{2.k} R^{3.l} R^{4/5.m} R^{10.n}$ ), the reading of which is as defined above, i.e. together with general formula I and the remaining features like x, y, as outlined directly below said matrix 0 or matrix I.

Matrix 0 and matrix I show in the right hand column the embodiments ( $\underline{Hc}^i R^{1,j} R^{2,k} R^{3,l} R^{4/5,m} R^{10,n}$ ) of the invention according to general formula I that are considered preferred, independent and separable of each other, i.e. individual aspects of the invention. The left hand column provides a reference number to such embodiments.

- The embodiments or elements are listed in the order from less preferred to most preferred, the preference of the embodiments is ascending with the reference number. This means that the embodiment, which is presented by the matrix element in the last row, last entry of matrix 0 or matrix I is the most preferred embodiment, while the embodiments of matrix I are preferred over the embodiments of matrix 0.
- Aspects 1 to 18 are the main aspects of the invention.

whereby for each matrix embodiment of matrix 0:

**x** independently from each other = 0, 1, 2, 3 or 4, preferably x = 0, 1 or 2; preferably being 0 or 1, more preferably x = 0:

y independently from each other y = 0, or 1; more preferably y = 0, whereby specific definitions with the embodiments of the matrix prevail;

and pharmaceutically acceptable salts and/or solvates thereof.

and with the proviso - for each embodiment of matrix 0 for that this proviso is applicable - such as for embodiments which comprise  $\underline{Hc}$  as defined by  $\underline{Hc}^1$  or  $\underline{Hc}^3$  - that

if <u>**Hc**</u> is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>-spacer.

It will be evident, that if x and/or y = 0 then  $\underline{Hc}$  is unsubstituted, i. e. the corresponding valences of the ring member atoms are saturated by hydrogen.

In case  $R^{10}$  is not sufficiently defined in matrix 0 it shall be  $R^{10.0.4}$  or  $R^{10.0.5}$ , preferably  $R^{10.0.5}$ .

## c.) subset of embodiments of matrix I with respect to ${\ensuremath{\mathsf{R}}}^{10}$

(c.1) In one individual and independent subset of embodiments according to the present invention concerns each embodiment selected from the group of matrix I with  $R^{10}$  being defined by  $R^{10.2}$ ,  $R^{10.3}$  or  $R^{10.4}$ : for the embodiments of this subset each of the definitions  $R^{10.2}$ ,  $R^{10.3}$  and  $R^{10.4}$  is extended so that  $R^{10}$  also may be H, in case this  $R^{10}$  is bound to a nitrogen atom.

This subset is called "subset c.1".

It will be evident that the subsets as defined under a.) and b.) within this section "Additional embodiments according to the invention / subset of aspects 1-17 and

# WO 2009/121919 PCT/EP2009/053907 - 107 -

the embodiments of matrix 0 or matrix I" correspond with embodiments of aspects 1 - 17 and matrix 0, matrix I respectively, whereby the scope of specific definitions is changed. In case these changes are limitations the new definitions can be considered to include provisos. Therefore these embodiments are considered to be only "subsets" of aspects 1 - 17 and the embodiments of matrix 0, matrix I respectively.

Each embodiment of general formula I defined by aspects 1 - 18 and any of the elements of matrix 0, matrix I, or each embodiment defined by the above subsets a.), b.) or c.) is considered an independent and separable aspect of the invention, i.e. an individual aspect of the invention.

### **USED TERMS AND DEFINITIONS**

Terms not specifically defined herein should be given the meanings that would be given to them by a person skilled in the art in light of the disclosure and the context. Examples include that specific substituents or atoms are presented with their 1 or 2 letter code, like H for hydrogen, N for nitrogen, C for carbon, O for oxygen, S for sulphur and the like. Optionally but not mandatorily the letter is followed by a hyphen to indicate a bond. As used in the specification, unless specified to the contrary, the following terms have the meaning indicated and the following conventions are adhered to.

In the groups, radicals, or moieties defined below, the number of carbon atoms is often specified preceding the group, for example,  $C_{1-6}$ -alkyl means an alkyl group or alkyl radical having 1 to 6 carbon atoms. In general, for groups comprising two or more subgroups, the last named group is the radical attachment point, for example, "thioalkyl" means a monovalent radical of the formula HS-alkyl-. If the term of a substituent starts or ends with a minus sign or hyphen, i.e. -. This sign emphasises the attachment point like in the aforementioned example HS-alkyl-, where the "alkyl" is linked to the group of which the HS-alkyl- is a substituent. Unless otherwise specified below, conventional definitions of terms control and conventional stable atom valences are presumed and achieved in all formulas and groups.

# WO 2009/121919 PCT/EP2009/053907 - 108 -

In general, all "tautomeric forms and isomeric forms and mixtures", whether individual geometric isomers or optical isomers or racemic or non-racemic mixtures of isomers, of a chemical structure or compound are intended, unless the specific stereochemistry or isomeric form is specifically indicated in the compound name or structure.

The term "substituted" as used herein explicitly or implicitly, means that any one or more hydrogen(s) on the designated atom is replaced with a member of the indicated group of substituents, provided that the designated atom's normal valence is not exceeded. In case a substituent is bound via a double bond, e.g. an oxo substituent, such substituent replaces two hydrogen atoms on the designated atom. The substitution shall result in a stable compound. "Stable" in this context preferably means a compound that from a pharmaceutical point of view is chemically and physically sufficiently stable in order to be used as an active pharmaceutical ingredient of a pharmaceutical composition.

If a substituent is not defined, it shall be hydrogen.

5

10

15

20

25

30

By the term "optionally substituted" is meant that either the corresponding group is substituted or it is not. Accordingly, in each occasion where this term is used, the non-substituted variation is a more pronounced aspect of the invention, i.e. preferably there are no such optional substituents.

The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, or other problem or complication, commensurate with a reasonable benefit/risk ratio.

As used herein, "pharmaceutically acceptable salt(s)" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic residues such as amines; alkali or organic salts of acidic residues such as carboxylic acids; and the like. The pharmaceutically acceptable salts include the conventional non-toxic salts or the

# WO 2009/121919 PCT/EP2009/053907 - 109 -

quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, sulfamic acid, phosphoric acid, nitric acid, and the like; and the salts prepared from organic acids such as acetic acid, propionic acid, succinic acid, glycolic acid, stearic acid, lactic acid, malic acid, tartaric acid, citric acid, ascorbic acid, pamoic acid, maleic acid, hydroxymaleic acid, phenylacetic acid, glutamic acid, benzoic acid, salicylic acid, sulfanilic acid, 2-acetoxybenzoic acid, fumaric acid, toluenesulfonic acid, methanesulfonic acid, ethane disulfonic acid, oxalic acid, isothionic acid, and the like. As the compounds of the present invention may have both, acid as well as basic groups, those compounds may therefore be present as internal salts too.

5

10

15

20

25

30

The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound which contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base form of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, non-aqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred.

"Prodrugs" are considered compounds that release an active parent drug of the present invention in vivo when such prodrug is administered to a mammalian subject. Prodrugs according to the present invention are prepared by modifying functional groups present in the compound in such a way that these modifications are retransformed to the original functional groups under physiological conditions. Prodrugs include compounds of the present invention wherein a hydroxy, amino, or sulfhydryl group is bound to any group that, when the prodrug of the present invention is administered to a mammalian subject, is retransformed to free said hydroxyl, amino, or sulfhydryl group. Examples of prodrugs include, but are not limited to, acetate, formate and benzoate derivatives of alcohol and amine functional groups in the compounds of the present invention.

"Metabolites" are considered as derivatives of the compounds according to the present invention that are formed in vivo. Active metabolites are such metabolites that cause a pharmacological effect. It will be appreciated that metabolites of the compounds according to the present inventions are subject to the present invention as well, in particular active metabolites.

Some of the compounds may form "solvates". For the purposes of the invention the term "solvates" refers to those forms of the compounds which form, in the solid or liquid state, a complex by coordination with solvent molecules. Hydrates are a specific form of solvates in which the coordination takes place with water. According to the present invention, the term preferably is used for solid solvates, such as amorphous or more preferably crystalline solvates.

"Scaffold": The scaffold of the compounds according to the present invention is represented by the following core structure, the numeration of which is indicated in bold:

5

10

15

20

It will be evident for the skilled person in the art, that this scaffold can be described by its tautomeric "enol" form

In the context of the present invention both structural representations of the scaffold shall be considered the subject of the present invention, even if only one of the two representatives is presented. It is believed that for the majority of compounds under ambient conditions and therewith under conditions which are the relevant conditions for a pharmaceutical composition comprising said compounds, the equilibrium of the tautomeric forms lies on the side of the pyrazolopyrimdin-4-one representation. Therefore, all embodiments are presented as pyrazolopyrimdin-4-one-derivatives or more precisely as pyrazolo[3,4-d]pyrimidin-4-one derivatives.

5

20

"Bonds": If within a chemical formula of a ring system or a defined group a substituent is directly linked to an atom or a group like "RyR" in below formula this shall mean that the substituent is only attached to the corresponding atom. If however from another substituent like "RxR" a bond is not specifically linked to an atom of the ring system but drawn towards the centre of the ring or group this means that this substituent "RxR" may be linked to any meaningful atom of the ring system / group unless stated otherwise.

The bond symbol "-" (= minus sign) or the symbol "- \*" (= minus sign followed by an asterisk sign) stands for the bond through which a substituent is bound to the corresponding remaining part of the molecule / scaffold. In cases in that minus sign does not seem to be sufficiently clear, an asterisk is added to the bond symbol "-" in order to determine the point of attachment of said bond with the corresponding main part of the molecule / scaffold.

In general, the bond to one of the herein defined heterocycloalkyl, heterocyclyl or heteroaryl groups may be effected via a C atom or optionally an N atom.

The term "aryl" used in this application denotes a phenyl, biphenyl, indanyl, indenyl, 1,2,3,4-tetrahydronaphthyl or naphthyl group, preferably it denotes a phenyl or

WO 2009/121919 PCT/EP2009/053907 - 112 -

naphtyl group, more preferably a phenyl group. This definition applies for the use of "aryl" in any context within the present description in the absence of a further definition.

The term "C<sub>1-n</sub>-alkyl" denotes a saturated, branched or unbranched hydrocarbon group with 1 to n C atoms, wherein n is a figure selected from the group of 2, 3, 4, 5, 6, 7, 8, 9, or 10, preferably from the group of 2, 3, 4, 5, or 6, more preferably from the group of 2, 3, or 4. Examples of such groups include methyl, ethyl, *n*-propyl, *iso*-propyl, butyl, *iso*-butyl, *sec*-butyl, *tert*-butyl, *n*-pentyl, *iso*-pentyl, *neo*-pentyl, *tert*-pentyl, *n*-hexyl, *iso*-hexyl etc. As will be evident from the context, such C<sub>1-n</sub>-alkyl group optionally can be substituted.

This definition applies for the use of "alkyl" in any reasonable context within the present description in the absence of a further definition.

15

20

25

30

In cases in which the term " $C_{1-n}$ -alkyl" is used in the middle of two other groups / substituents, like for example in " $C_{1-n}$ -cylcoalkyl- $C_{1-n}$ -alkyl-O-", this means that the " $C_{1-n}$ -alkyl"-moiety bridges said two other groups. In the present example it bridges the  $C_{1-n}$ -cylcoalkyl with the oxygen like in "cyclopropyl-methyl-oxy-". It will be evident, that in such cases " $C_{1-n}$ -alkyl" has the meaning of a " $C_{1-n}$ -alkylene" spacer like methylene, ethylene etc. The groups that are bridged by " $C_{1-n}$ -alkyl" may be bound to " $C_{1-n}$ -alkyl" at any position thereof. Preferably the right hand group is located at the distal right hand end of the alkyl group and left hand group at the distal left hand side of the alkyl group. The same applies for other substituents.

The term " $C_{2-n}$ -alkenyl" denotes a branched or unbranched hydrocarbon group with 2 to n C atoms and at least one C=C group (i.e. carbon – carbon double bond), wherein n preferably has a value selected from the group of 3, 4, 5, 6, 7, or 8, more preferably 3, 4, 5, or 6, more preferably 3 or 4. Examples of such groups include ethenyl, 1-propenyl, 2-propenyl, *iso*-propenyl, 1-butenyl, 2-butenyl, 3-butenyl, 2-methyl-1-propenyl, 1-pentenyl, 2-pentenyl, 3-pentenyl, 4-pentenyl, 3-methyl-2-butenyl, 1-hexenyl, 2-hexenyl, 3-hexenyl, 4-hexenyl, 5-hexenyl etc. As will be evident from the context, such  $C_{2-n}$ -alkenyl group optionally can be substituted.

This definition applies for the use of "alkenyl" in any reasonable context within the present description in the absence of a further definition if no other definition.

In cases in which the term " $C_{2-n}$ -alkenyl" is used in the middle of two other groups / substituents, the analogue definition as for  $C_{1-n}$ -alkyl applies.

5

10

15

The term " $C_{2-n}$ -alkynyl" denotes a branched or unbranched hydrocarbon group with 2 to n C atoms and at least one C $\equiv$ C group (i.e. a carbon-carbon triple bond), wherein n preferably has a value selected from the group of 3, 4, 5, 6, 7, or 8, more preferably 3, 4, 5, or 6, more preferably 3 or 4. Examples of such groups include ethynyl, 1-propynyl, 2-propynyl, 1-butynyl, 2-butynyl, 3-butynyl, 1-pentynyl, 2-pentynyl, 3-pentynyl, 4-pentynyl, 1-hexynyl, 2-hexynyl, 3-hexynyl, 4-hexynyl, 5-hexynyl etc. As will be evident from the context, such  $C_{2-n}$ -alkynyl group optionally can be substituted.

This definition applies for the use "alkynyl" in any reasonable context within the present description in the absence of a further definition.

In cases in which the term " $C_{2-n}$ -alkynyl" is used in the middle of two other groups / substituents, the analogue definition as for  $C_{1-n}$ -alkyl applies.

The term " $C_{3-n}$ -cycloalkyl" denotes a saturated monocyclic group with 3 to n C ring atoms. n preferably has a value of 4 to 8 (= 4, 5, 6, 7, or 8), more preferably 4 to 7, more preferably such  $C_{3-n}$ -cycloalkyl is 5 or 6 membered. Examples of such groups include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl etc.. This definition applies for "cycloalkyl" in any reasonable context within the present description in the absence of a further definition.

25

30

20

The term "halogen" denotes an atom selected from among F, Cl, Br, and I.

The term "heteroaryl" used in this application denotes a heterocyclic, mono- or bicyclic aromatic ring system which includes within the ring system itself in addition to at least one C atom one or more heteroatom(s) independently selected from N, O, and/or S. A monocyclic ring system preferably consists of 5 to 6 ring members, a bicyclic ring system preferably consists of 8 to 10 ring members. Preferred are

# WO 2009/121919 PCT/EP2009/053907

heteroaryls with up to 3 heteroatoms, more preferred up to 2 heteroatoms, more preferred with 1 heteroatom. Preferred heteroatom is N. Examples of such moieties benzimidazolyl, benzisoxazolyl, benzo[1,4]-oxazinyl, benzoxazol-2-onyl, benzofuranyl, benzoisothiazolyl, 1,3-benzodioxolyl, benzothiadiazolyl, benzothiazolyl, benzothienyl, benzoxadiazolyl, benzoxazolyl, chromanyl, chromenyl, chromonyl, cinnolinyl, 2,3-dihydrobenzo[1,4]dioxinyl, 2,3-dihydrobenzofuranyl, 3,4dihydrobenzo[1,4]oxazinyl, 2,3-dihydroindolyl, 1,3-dihydroisobenzofuranyl, 2.3dihydroisoindolyl, 6,7-dihydropyrrolizinyl, dihydroguinolin-2-onyl, dihydroguinolin-4furanyl, imidazo[1,2-a]pyrazinyl, imidazo[1,2-a]pyridyl, imidazolyl, onyl, imidazopyridyl, imidazo[4,5-d]thiazolyl, indazolyl, indolizinyl, indolyl, isobenzofuranyl, isobenzothienvl. isochromanyl. isochromenyl, isoindoyl, isoquinolin-2-onyl, 1,2,4-oxadiazoyl, 1,3,4isoquinolinyl, isothiazolyl, isoxazolyl, naphthyridinyl, oxadiazoyl, 1,2,5-oxadiazoyl, oxazolopyridyl, oxazolyl, 2-oxo-2,3dihydrobenzimidazolyl, 2-oxo-2,3-dihydroindolyl, 1-oxoindanyl, phthalazinyl, pteridinyl, purinyl, pyrazinyl, pyrazolo[1,5-a]pyridyl, pyrazolo[1,5-a]pyrimidinyl, pyrazolyl, pyridazinyl, pyridopyrimidinyl, pyridyl (pyridinyl), pyridyl-N-oxide, pyrimidinyl, pyrimidopyrimidinyl, pyrrolopyridyl, pyrrolopyrimidinyl, pyrrolyl, quinazolinyl, quinolin-4-onyl, quinolinyl, quinoxalinyl, 1,2,3,4-tetrahydroquinolinyl, 1,2,3,4-tetrahydroisoguinolinyl, tetrazolyl, 1,2,4-thiadiazolyl, 1,3,4-thiadiazolyl, 1,2,5thiadiazolyl, thiazolyl, thieno[2,3-d]imidazolyl, thieno[3,2-b]pyrrolyl, thieno[3,2b]thiophenyl, thienyl, triazinyl, or triazolyl.

10

15

20

25

30

Preferred heteroaryl groups are furanyl, isoxazolyl, pyrazolyl, pyridyl, pyrimidinyl, thienyl, and thiazolyl.

More preferred heteroaryl groups are oxadiazolyl, triazolyl, pyrazolyl, furanyl, and pyridyl, more preferred is pyrazolyl and pyridyl.

The definition pyrazole includes the isomers 1H-, 3H- and 4H-pyrazole. Preferably pyrazolyl denotes 1H-pyrazolyl.

The definition imidazole includes the isomers 1H-, 2H- and 4H-imidazole. A preferred definition of imidazolyl is 1H-imidazolyl.

The definition triazole includes the isomers 1H-, 3H- and 4H-[1,2,4]-triazole as well as 1H-, 2H- and 4H-[1,2,3]-triazole. The definition triazolyl therefore includes 1H-[1,2,4]-triazol-1-, -3- and -5-yl, 3H-[1,2,4]-triazol-3- and -5-yl, 4H-[1,2,4]-triazol-3-, -4- and -5-yl, 1H-[1,2,3]-triazol-1-, -4- and -5-yl, 2H-[1,2,3]-triazol-2-, -4- and -5-yl as well as 4H-[1,2,3]-triazol-4- and -5-yl.

The term tetrazole includes the isomers 1H-, 2H- and 5H-tetrazole. The definition tetrazolyl therefore includes 1H-tetrazol-1- and -5-yl, 2H-tetrazol-2- and -5-yl and 5H-tetrazol-5-yl.

10

5

The definition indole includes the isomers 1H- and 3H-indole. The term indolyl preferably denotes 1H-indol-1-yl.

The term isoindole includes the isomers 1H- and 2H-isoindole.

15

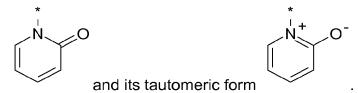

This definition applies for "heteroaryl" in any reasonable context within the present description in the absence of a further definition.

The term "N-linked-pyridine-2-one" used in this application denotes:

20

25

30

The term "heterocycloalkyl" within the context of the present invention denotes a saturated 3 to 8 membered, preferably 5-, 6- or 7-membered ring system or a 5-12 membered bicyclic ring system, which include 1, 2, 3 or 4 heteroatoms, selected from N, O, and/or S. Preferred are 1, 2, or 3 heteroatoms.

The preferred number of carbon atoms is 3 to 7 with 1, 2, 3 or 4 heteroatoms selected from N, O, and/or S. Such heterocycloalkyl groups are addressed as  $C_{3-}$ 7-heterocycloalkyl.

Preferred are saturated heterocycloalkyl rings with 5, 6, or 7 ring atoms, of which 1 or 2 are heteroatoms and the remaining are C-atoms.

Wherever C<sub>3-7</sub>-heterocycloalkyl- substituents are mentioned, the preferred embodiments thereof are 5-, 6-,- or 7-membered cycles, more preferably monocycles. They include 1, 2, 3, or 4 heteroatoms, selected from N, O, and/or S, whereby 1 or 2 such heteroatoms are preferred, more preferably 1 such heteroatom.

5

10

Preferred example for heterocycloalkyl include morpholinyl, piperidinyl, piperazinyl, thiomorpholinyl, oxathianyl, dithianyl, dioxanyl, pyrrolidinyl, tetrahydrofuranyl, dioxolanyl, oxathiolanyl, imidazolidinyl, tetrahydropyranyl, pyrrolinyl, tetrahydrothienyl, oxazolidinyl, homopiperazinyl, homopiperidinyl, homomorpholinyl, homothiomorpholinyl, azetidinyl, 1,3-diazacyclohexanyl or pyrazolidinyl group.

This definition applies for "heterocycloalkyl" in any reasonable context within the present description in the absence of a further specific definition.

20

15

The term "heterocyclyl" specifically is used to define the group <u>Hc</u> in formula I and formulae which are derived thereof and therefore will be independently used from the definition of "heterocycloalkyl". However, the definitions for "heterocycloalkyl" shall be comprised within the definition for "heterocyclyl". <u>Hc</u> is a group which is or at least comprises a non-aromatic heterocycloalkyl group which is bound to the scaffold.

25

Within the context of the present invention and as used herein, specifically within the context of  $\underline{Hc}$ , "heterocyclyl" means a non-aromatic monocyclic, bicyclic or tricyclic ring system, whereby the ring members are carbon atoms and at least one, preferably one to three heteroatom(s) selected from the group of nitrogen, oxygen, or sulphur, the sulphur being part the group  $-S(O)_r$  - with r being 0, 1 or 2. Such ring system may further be bridged. Such systems also will be called heteromonocyclic, heterobicyclic, or heterotricyclic ring system within the present context.

30

This heterocyclyl group may be saturated or partly unsaturated, whereby in systems with more than one ring system, at least one of them is not aromatic. This at least one non aromatic ring system comprises said at least one heteroatom.

This heterocyclyl group may be bound to the scaffold in more than one way. If no particular bonding arrangement is specified, then all possible arrangements are

# WO 2009/121919 PCT/EP2009/053907 - 117 -

intended. For example, the term "tetrahydropyranyl" includes 2-, 3-, or 4-tetrahydropyranyl and the like. In cases with more than one ring system, the bonding to the scaffold is via at least one ring atom of the non aromatic ring system comprising at least one heteroatom. Preferably this heterocyclyl-group is bound to the scaffold via a nitrogen atom or one of the saturated carbon atoms in said ring system. More preferably it is attached to the scaffold via a carbon atom of the non-aromatic heterocyclic ring system.

5

10

25

Such heterocyclyl group may be fused, respectively annelated, with a cycloalkyl, another heterocyclic group, an aromatic ring system, such as phenyl or may be part of a spirocyclic system. In a fused or annelated system, the two ring systems share a bond between two adjacent ring atoms. In the spiro variation, the two ring systems have one ring atom in common.

The monoheterocyclic ring systems within this definition are non-aromatic monocyclic ring systems, in which at least one, preferably one to three, of the carbon atoms have been replaced with a heteroatom such as nitrogen, oxygen, or sulphur, the sulphur being part the group – S(O)<sub>r</sub> - with r being 0, 1 or 2 comprises preferably 4 to 8 ring atoms. Within this context preferred are 5-, 6- or 7-membered, saturated or at least partly unsaturated heterocyclic rings

The heterobicyclic ring systems within this definition are bicyclic ring systems with at least one, preferably one to three, of the carbon atoms have been replaced with a heteroatom such as nitrogen, oxygen, or sulphur, the sulphur being part the group  $-S(O)_r$  - with r being 0, 1 or 2; the ring system has at least one non-aromatic ring, which comprises said at least one heteroatom, and the bicyclic ring system comprises preferably 7 to 12 ring atoms. Within this context preferred are 8-, 9- or 10-membered, saturated or at least partly unsaturated heterocyclic rings.

30 The heterotricyclic ring systems within this definition are tricyclic systems of annelated monocycles, in which at least one, preferably one to three, of the carbon atoms have been replaced with a heteroatom such as nitrogen, oxygen, or sulphur, the sulphur being part the group – S(O)<sub>r</sub> - with r being 0, 1 or 2; the ring system has

at least one non-aromatic ring, which comprises said at least one heteroatom, and the tricyclic ring system comprises preferably 7 to 14 ring atoms.

By the term spirocyclic system as mentioned within this definition, are meant preferably 5-10 membered, spirocyclic rings which may optionally contain 1, 2 or 3 heteroatoms, selected from among oxygen, sulphur, and nitrogen. Such systems optionally may be annelated with an aromatic ring system such as phenyl.

5

10

15

The order of preference of heterocyclic ring systems is: monocyclic ring systems are more preferred than bicyclic ring systems, which are more preferred than tricyclic ones.

Examples for such heterocyclic  $\underline{\textit{Hc}}$  groups according to the present invention are the following groups:

WO 2009/121919 - 119 -

, wherein -\* stands for the bond by which said group is bound to the nitrogen atom of the scaffold, that is numbered as 1.

5 The above definition applies for "heterocyclyl" in any reasonable context within the present description in the absence of a further definition.

The term "oxo" denotes an oxygen atom as substituent that is bonded by a double bond, preferably it is bonded to a C-atom. In case oxo is used as a substituent, the oxo replaces two hydrogen atoms of the corresponding atom of the unsubstituted compound.

5

The following schemes shall illustrate a process to manufacture the compounds of the present invention by way of example:

### Scheme 1

10

Scheme 1: In a first step 2-ethoxymethylene-malononitrile is condensed with monosubstituted hydrazines by heating in an appropriate solvent like ethanol in the presence of a base (e.g. triethylamine) to form 5-amino-1H-pyrazole-4-carbonitriles.

WO 2009/121919 PCT/EP2009/053907 - 121 -

These compounds are converted in a second step to the corresponding amides, e.g. by treatment of an ethanolic solution with ammonia (25 % in water) and hydrogen peroxide (35 % in water). In a third step, heating with carboxylic esters under basic conditions (e.g sodium hydride in ethanol) or carboxylic acids with an activation reagent (e.g. polyphosporic acid) leads to pyrazolo[3,4-d]pyrimidin-4-ones as final products [cf., for example, A. Miyashita *et al.*, *Heterocycles* **1990**, *31*, 1309ff].

Schemes 2 and 3 illustrate alternative methods to prepare the final compounds: in these exemplified manufacturing methods 5-amino-1H-pyrazole-4-carboxylic acid amides are condensed in a first step with an appropriate ester derivative followed in a second step by alkylation with suitable electrophiles.

The compounds of the invention show a valuable range of pharmacological effects which could not have been predicted. They are characterised in particular by inhibition of PDE9A.

5 Preferably the compounds according to the present invention show a high selectivity profile in view of inhibiting or modulating specific members within the PDE9 family or other PDE families, with a clear preference (selectivity) towards PDE9A inhibition.

The compounds of the present invention are supposed to show a favourable safety profile.

#### METHOD OF TREAMENT

The present invention refers to compounds, which are considered effective and selective inhibitors of phosphodiesterase 9A and can be used for the development of medicaments. Such medicaments shall preferably be used for the treatment of diseases in which the inhibition of PDE9A can evolve a therapeutic, prophylactic or disease modifying effect. Preferably the medicaments shall be used to improve perception, concentration, cognition, learning or memory, like those occurring in particular in situations/diseases/syndromes such as mild cognitive impairment, ageassociated learning and memory impairments, age-associated memory losses, vascular dementia, craniocerebral trauma, stroke, dementia occurring after strokes (post stroke dementia), post-traumatic dementia, general concentration impairments, concentration impairments in children with learning and memory problems, Alzheimer's disease, Lewy body dementia, dementia with degeneration of the frontal lobes, including Pick's syndrome, Parkinson's disease, progressive nuclear palsy, dementia with corticobasal degeneration, amyotropic lateral sclerosis (ALS), Huntington's disease, multiple sclerosis, thalamic degeneration, Creutzfeld-Jacob dementia, HIV dementia, schizophrenia with dementia or Korsakoff's psychosis.

Another aspect of the present invention concerns the treatment of a disease which is accessible by PDE9A modulation, in particular sleep disorders like insomnia or narcolepsy, bipolar disorder, metabolic syndrome, obesity, diabetis mellitus, including

WO 2009/121919 PCT/EP2009/053907 - 127 -

type 1 or type 2 diabetes, hyperglycemia, dyslipidemia, impaired glucose tolerance, or a disease of the testes, brain, small intestine, skeletal muscle, heart, lung, thymus or spleen.

5 Thus the medical aspect of the present invention can be summarised in that it is considered that a compound according to any of the genius embodiments of the invention as outlined herein, in particular the one according to formula I as defined by each of the aspects 1 – 17, each of the elements/embodiments of matrix 0 or matrix I or a compound selected from the group of the exemplified final compounds (see aspect 18 or chapter exemplary embodiments) is used as a medicament.

Such a medicament preferably is for the treatment of a CNS disease.

15

In an alternative use, the medicament is for the treatment of a CNS disease, the treatment of which is accessible by the inhibition of PDE9.

In an alternative use, the medicament is for the treatment of a disease that is accessible by the inhibition of PDE9.

In an alternative use, the medicament is for the treatment, amelioration and / or prevention of cognitive impairment being related to perception, concentration, cognition, learning or memory.

- In an alternative use, the medicament is for the treatment amelioration and / or prevention of cognitive impairment being related to age-associated learning and memory impairments, age-associated memory losses, vascular dementia, craniocerebral trauma, stroke, dementia occurring after strokes (post stroke dementia), post-traumatic dementia, general concentration impairments,
- concentration impairments in children with learning and memory problems,
   Alzheimer's disease, Lewy body dementia, dementia with degeneration of the frontal lobes, including Pick's syndrome, Parkinson's disease, progressive nuclear palsy, dementia with corticobasal degeneration, amyotropic lateral sclerosis (ALS),
   Huntington's disease, multiple sclerosis, thalamic degeneration, Creutzfeld-Jacob dementia, HIV dementia, schizophrenia with dementia or Korsakoff's psychosis.

In an alternative use, the medicament is for the treatment of Alzheimer's disease.

In an alternative use, the medicament is for the treatment of sleep disorders, bipolar disorder, metabolic syndrome, obesity, diabetis mellitus, hyperglycemia, dyslipidemia, impaired glucose tolerance, or a disease of the testes, brain, small intestine, skeletal muscle, heart, lung, thymus or spleen.

#### PHARMACEUTICAL COMPOSITIONS

5

10

15

20

25

30

Medicaments for administration comprise a compound according to the present invention in a therapeutically effective amount. By "therapeutically effective amount" it is meant that if the medicament is applied via the appropriate regimen adapted to the patient's condition, the amount of said compound of formula (I) will be sufficient to effectively treat, to prevent or to decelerate the progression of the corresponding disease, or otherwise to ameliorate the estate of a patient suffering from such a disease. It may be the case that the "therapeutically effective amount" in a monotherapy will differ from the "therapeutically effective amount" in a combination therapy with another medicament.

The dose range of the compounds of general formula (I) applicable per day is usually from 0.1 to 5000 mg, preferably 0.1 to 1000 mg, preferably from 2 to 500 mg, more preferably from 5 to 250 mg, most preferably from 10 to 100 mg. A dosage unit (e.g. a tablet) preferably contains between 2 and 250 mg, particularly preferably between 10 and 100 mg of the compounds according to the invention.

The actual pharmaceutically effective amount or therapeutic dosage will of course depend on factors known by those skilled in the art such as age, weight, gender or other condition of the patient, route of administration, severity of disease, and the like.

The compounds according to the invention may be administered by oral, parenteral (intravenous, intramuscular etc.), intranasal, sublingual, inhalative, intrathecal, topical or rectal route. Suitable preparations for administering the compounds according to the present invention include for example patches, tablets, capsules, pills, pellets, dragees, powders, troches, suppositories, liquid preparations such as solutions,

WO 2009/121919 PCT/EP2009/053907 - 129 -

suspensions, emulsions, drops, syrups, elixirs, or gaseous preparations such as aerosols, sprays and the like. The content of the pharmaceutically active compound(s) should be in the range from 0.05 to 90 wt.- %, preferably 0.1 to 50 wt.- % of the composition as a whole. Suitable tablets may be obtained, for example, by mixing the active substance(s) with known excipients, for example inert diluents such as calcium carbonate, calcium phosphate or lactose, disintegrants such as corn starch or alginic acid, binders such as starch or gelatine, lubricants such as magnesium stearate or talc and/or agents for delaying release, such as carboxymethyl cellulose, cellulose acetate phthalate, or polyvinyl acetate. The tablets may also comprise several layers.

Coated tablets may be prepared accordingly by coating cores produced analogously to the tablets with substances normally used for tablet coatings, for example collidone or shellac, gum arabic, talc, titanium dioxide or sugar. To achieve delayed release or prevent incompatibilities the core may also consist of a number of layers. Similarly the tablet coating may consist of a number of layers to achieve delayed release, possibly using the excipients mentioned above for the tablets.

Syrups or elixirs containing the active substances or combinations thereof according to the invention may additionally contain a sweetener such as saccharine, cyclamate, glycerol or sugar and a flavour enhancer, e.g. a flavouring such as vanillin or orange extract. They may also contain suspension adjuvants or thickeners such as sodium carboxymethyl cellulose, wetting agents such as, for example, condensation products of fatty alcohols with ethylene oxide, or preservatives such as p-hydroxybenzoates.

25

30

10

15

20

Solutions are prepared in the usual way, e.g. with the addition of isotonic agents, preservatives such as p-hydroxybenzoates or stabilisers such as alkali metal salts of ethylenediaminetetraacetic acid, optionally using emulsifiers and/or dispersants, while if water is used as diluent, for example, organic solvents may optionally be used as solubilisers or dissolving aids, and the solutions may be transferred into injection vials or ampoules or infusion bottles.

Capsules containing one or more active substances or combinations of active substances may for example be prepared by mixing the active substances with inert carriers such as lactose or sorbitol and packing them into gelatine capsules.

5 Suitable suppositories may be made for example by mixing with carriers provided for this purpose, such as neutral fats or polyethyleneglycol or the derivatives thereof.

10

15

20

Excipients which may be used include, for example, water, pharmaceutically acceptable organic solvents such as paraffins (e.g. petroleum fractions), vegetable oils (e.g. groundnut or sesame oil), mono- or polyfunctional alcohols (e.g. ethanol or glycerol), carriers such as e.g. natural mineral powders (e.g. kaolins, clays, talc, chalk), synthetic mineral powders (e.g. highly dispersed silicic acid and silicates), sugars (e.g. cane sugar, lactose and glucose), emulsifiers (e.g. lignin, spent sulphite liquors, methylcellulose, starch and polyvinylpyrrolidone) and lubricants (e.g. magnesium stearate, talc, stearic acid and sodium lauryl sulphate).

For oral use the tablets may obviously contain, in addition to the carriers specified, additives such as sodium citrate, calcium carbonate and dicalcium phosphate together with various additional substances such as starch, preferably potato starch, gelatin and the like. Lubricants such as magnesium stearate, sodium laurylsulphate and talc may also be used to produce the tablets. In the case of aqueous suspensions the active substances may be combined with various flavour enhancers or colourings in addition to the abovementioned excipients.

The dosage of the compounds according to the invention is naturally highly dependent on the method of administration and the complaint which is being treated. When administered by inhalation the compounds of formula (I) are characterised by a high potency even at doses in the microgram range. The compounds of formula (I) may also be used effectively above the microgram range. The dosage may then be in the gram range, for example.

#### **COMBINATIONS WITH OTHER ACTIVE SUBSTANCES**

# WO 2009/121919 PCT/EP2009/053907 - 131 -

In another aspect the present invention relates to the above-mentioned pharmaceutical formulations as such which are characterised in that they contain a compound according to the present invention.

5

10

15

20

25

30

A further aspect of the present invention refers to a combination of each of the compounds of the present invention, preferably at least one compound according to the present invention with another compound selected from the group of for example beta-secretase inhibitors; gamma-secretase inhibitors; gamma-secretase modulators; amyloid aggregation inhibitors such as e.g. alzhemed; directly or indirectly acting neuroprotective and/or disease-modifying substances; anti-oxidants, such as e.g. vitamin E, ginko biloba or ginkolide; anti-inflammatory substances, such as e.g. Cox inhibitors, NSAIDs additionally or exclusively having Aß lowering properties; HMG-CoA reductase inhibitors, such as statins; acetylcholine esterase inhibitors, such as donepezil, rivastigmine, tacrine, galantamine; NMDA receptor antagonists such as e.g. memantine; AMPA receptor agonists; AMPA receptor positive modulators, AMPkines - monoamine receptor reuptake inhibitors; substances modulating the concentration or release of neurotransmitters; substances inducing the secretion of growth hormone such as ibutamoren mesylate and capromorelin; CB-1 receptor antagonists or inverse agonists; antibiotics such as minocyclin or rifampicin; PDE1, PDE2, PDE4, PDE5 and / or PDE10 inhibitors, GABAA receptor inverse agonists; GABAA receptor antagonists; nicotinic receptor agonists or partial agonists; alpha4beta2 nicotinic receptor agonists or partial agonists; alpha7 nicotinic receptor agonists or partial agonists; histamine receptor H3 antagonists; 5-HT4 receptor agonists or partial agonists; 5-HT6 receptor antagonists; alpha2-adrenoreceptor antagonists, calcium antagonists; muscarinic receptor M1 agonists or positive modulators; muscarinic receptor M2 antagonists; muscarinic receptor M4 antagonists; metabotropic glutamate receptor 5 positive modulators; metabotropic glutamate receptor 2 antagonists, and other substances that modulate receptors or enzymes in a manner such that the efficacy and/or safety of the compounds according to the invention is increased and/or unwanted side effects are reduced.

This invention further relates to pharmaceutical compositions containing one or more, preferably one active substance, which is selected from the compounds according to

# WO 2009/121919 PCT/EP2009/053907 - 132 -

the invention and/or the corresponding salts, as well as one or more, preferably one active substance selected from among alzhemed, vitamin E, ginkolide, donepezil, rivastigmine, tacrine, galantamine, memantine, ibutamoren mesylate, capromorelin, minocyclin and/or rifampicin, optionally together with one or more inert carriers and/or diluents.

5

10

15

20

25

30

The compounds according to the invention may also be used in combination with immunotherapies such as e.g. active immunisation with Abeta or parts thereof or passive immunisation with humanised anti-Abeta antibodies or antibodyfragments or nanobodies for the treatment of the above-mentioned diseases and conditions.

The combinations according to the present invention may be provided simultaneously in one and the same dosage form, i.e. in form of a combination preparation, for example the two components may be incorporated in one tablet, e. g. in different layers of said tablet. The combination may be also provided separately, in form of a free combination, i.e the compounds of the present invention are provided in one dosage form and one or more of the above mentioned combination partners is provided in another dosage form. These two dosage forms may be equal dosage forms, for example a co-administration of two tablets, one containing a therapeutically effective amount of the compound of the present invention and one containing a therapeutically effective amount of the above mentioned combination partner. It is also possible to combine different administration forms, if desired. Any type of suitable administration forms may be provided.

The compound according to the invention, or a physiologically acceptable salt thereof, in combination with another active substance may be used simultaneously or at staggered times, but particularly close together in time. If administered simultaneously, the two active substances are given to the patient together; if administered at staggered times the two active substances are given to the patient successively within a period of less than or equal to 12, particularly less than or equal to 6 hours.

The dosage or administration forms are not limited, in the frame of the present invention any suitable dosage form may be used. Exemplarily the dosage forms may

be selected from solid preparations such as patches, tablets, capsules, pills, pellets, dragees, powders, troches, suppositories, liquid preparations such as solutions, suspensions, emulsions, drops, syrups, elixirs, or gaseous preparations such as aerosols, sprays and the like.

5

The dosage forms are advantageously formulated in dosage units, each dosage unit being adapted to supply a single dose of each active component being present. Depending from the administration route and dosage form the ingredients are selected accordingly.

10

15

The dosage for the above-mentioned combination partners is expediently 1/5 of the normally recommended lowest dose up to 1/1 of the normally recommended dose.

The dosage forms are administered to the patient for example 1, 2, 3, or 4 times daily depending on the nature of the formulation. In case of retarding or extended release formulations or other pharmaceutical formulations, the same may be applied differently (e.g. once weekly or monthly etc.). It is preferred that the compounds of the invention be administered either three or fewer times, more preferably once or twice daily.

### **BIOLOGICAL ASSAY**

The in vitro effect of the compounds of the invention can be shown with the following biological assays.

### 15 PDE9A2 assay protocol:

The PDE9A2 enzymatic activity assay was run as scintillation proximity assay (SPA), in general according to the protocol of the manufacturer (Amersham Biosciences, product number: TRKQ 7100).

As enzyme source, lysate (PBS with 1 % Triton X-100 supplemented with protease inhibitors, cell debris removed by centrifugation at 13.000 rpm for 30 min) of SF 9 cell expressing the human PDE9A2 was used. The total protein amount included in the assay varied upon infection and production efficacy of the SF9 cells and lay in the range of 0.1 - 100 ng.

25 In general, the assay conditions were as follows:

total assay volume: 40 microliter

protein amount: 0.1 – 50 ng

substrate concentration (cGMP): 20 naomolar; ~1 mCi/l

incubation time:
 60 min at room temperature

final DMSO concentration: 0.2 - 1 %

The assays were run in 384-well format. The test reagents as well as the enzyme and the substrate were diluted in assay buffer. The assay buffer contained 50 mM

# WO 2009/121919 PCT/EP2009/053907 - 137 -

Tris, 8.3 mM MgCl2, 1.7 mM EGTA, 0.1 % BSA, 0.05 % Tween 20; the pH of assay buffer was adjusted to 7.5. The reaction was stopped by applying a PDE9 specific inhibitor (e.g. compounds according to WO04099210) in excess.

#### 5 **Determination of % inhibition:**

The activity of the positive control (minus the negative control = background) is set to 100 % and activity in the presence of test compound is expressed relative to these 100 %. Within this setting, an inhibition above 100 % might be possible due to the nature of the variation of the positive control within the assay, however, in this case the reported % inhibition had been adjusted to 100 %.

# **Determination of IC**<sub>50</sub>:

 $IC_{50}$  can be calculated with GraphPadPrism or other suited software setting the positive control as 100 and the negative control as 0. For calculation of  $IC_{50}$  dilutions of the test compounds (substrates) are to be selected and tested following the aforementioned protocol.

#### Data

10

15

In the following, % inhibition data will illustrate that the compounds according to the present invention are suited to inhibit PDE9 and thus provide useful pharmacological properties. The examples are not meant to be limiting. The table also provides IC<sub>50</sub> values. The values are presented as being within a nanomolar range (nM), i.e. within the range of either 1 nanomolar to 100 nanomolar or within the range of 101 nanomolar to 1200 nanomolar. The specific IC<sub>50</sub> value is within said range. The example number refer to the final examples as outlined in the section **Exemplary embodiments** (see also aspect 18 of the invention).

All data are measured according to the procedure described herein.

### General comment concerning the presentation of the structures

Some compounds have one or more chiral centres. The depicted structure will not necessarily show all the possible stereochemical realisation of the compound but only one. However, in such cases a term like "cis-racemic mixture" is depicted next to the structure in order to point to the other stereochemical options.

An example is given for Example 7D, below. The presented structural formula is

Cis - racemic mixture

The added term "cis - racemic mixture" points to the second stereochemical option:

This principle applies to other depicted structures as well.

## **Synthesis**

In the following the manufacture of compounds which exemplify the present invention is described. In case the process of manufacture of a specific compound has not been disclosed literally, the skilled person in the art will find a description of analogue procedures within these descriptions which he can follow in principle. At some places it is said, the examples can be prepared in analogy to another example. If reference should be made to such an "analogue process" the reactions conditions are about the same, even if molar ratios of reagents and educts might to be adjusted. It also will be evident that starting materials within a described process can be varied chemically to achieve the same results, i.e. if a condensation reaction of an ester is described, in that the alcoholic component is a leaving group but not subject of the product, this alcoholic component may vary without significant changes of the procedure as such.

#### **Starting compounds:**

### Example 1A

A solution of 70 g (201 mmol) carbethoxymethylene triphenylphosphorane in 300 mL diethyl ether was cooled to 0°C and 25 g (198 mmol) 1.,1,1-trifluorobutanone was added. The solution was warmed to room temperature and stirred over night. The reaction mixture was filtered and the filtrate was concentrated under reduced pressure (700 mbar and 40°C bath temperature). The residue was purified by vacuum distillation (170 mbar and 130°C bath temperature, main fraction: 95-96°C). 29 g (75 %) of the product were obtained as colourless oil.

HPLC-MS (Method 1): Rt: 1.77 min

MS (ESI pos):  $m/z = 196 (M+H)^{+}$ 

### Example 1AA

400 mg (10.0 mmol) sodium hydride (60 % in mineral oil) was suspended in 10 ml THF and cooled to 4°C. While being stirred, a solution of 1.3 ml (8.99 mmol) trimethylphosphono acetate in 10 ml THF was added. The mixture was stirred for 1 h at the same temperature. After this, a solution of 4,4-difluorocyclohexanone in 10 ml THF was added at 0°C. The mixture was allowed to warm to room temperature and stirred for 14 h. THF and water was added and the THF evaporated. The remainder was diluted with ethyl acetate, washed with water and saturated sodium hydrogen carbonate solution and evaporated to yield 1.49 g (95 %) of the product.

MS (EI):  $m/z = 190 (M)^{+}$ 

The following examples 1B, 1C, 1D, 1E, 2A, 2B, 2C and 2D show how the racemic acids 3-trifluoromethyl-pentanoic acid and 3-trifluoromethyl-butyric acid can be transferred into the two enantiomeric forms of the free acid. The resolution can be done via separation of diastereomeric intermediates. The two pure enantiomeric forms of the free acid will be called enantiomer A, enatiomer B respectively. The corresponding diastereomeric intermediates will be called diastereomer A, diastereomer B respectively.

The same principle may be applied for enantiomeric resolution of other racemic mixtures if appropriate.

#### Example 1B

#### Diastereoisomer A

A solution of racemic 3-trifluoromethyl-pentanoic acid (8 g, 47 mmol), TBTU (16.6 g, 52 mmol) and diisopropylethylamine (24.1 mL, 141 mmol) in dimethylformamide (80 mL) was stirred at 20°C for 1h then (*S*)-(-)-1-phenylethylamine (10 g, 82 mmol) was added and the mixture was stirred for 16 h at 20°C. The solvent was removed and dichloromethane (200 mL) was added. The resulting mixture was washed with citric acid 10 % in water (200 mL), K<sub>2</sub>CO<sub>3</sub> 20 % in water (100 mL) and dried over sodium sulphate. Evaporation of the solvent gave a crude solid that was mixed with methanol (10 mL) and filtered through a pad of activated basic alumina. Separation of diastereoisomers was obtained by flash chromatography on SiO<sub>2</sub> eluting with a mixture of cyclohexane/ethyl acetate 85/15.

### Example 2A

4,4,4-Trifluoro-N-((R)-2-hydroxy-1-phenyl-ethyl)-3-methyl-butyramide, Diastereoisomer A

A solution of 3-(trifluoromethyl)butyric acid (10 g, 64 mmol) in dimethylformamide (100mL) was treated with N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride (14.7 g, 77 mmol), 4-dimethyl-amino pyridine (11 g, 89.7 mmol) and

(R)-(-)-phenylglycinol (9.9 g, 70.5 mmol). The mixture was stirred at 20°C for 16h, then concentrated to reduce the volume and treated with 10 % citric acid in water (300 mL). The mixture was extracted with ethyl ether (2x 200mL) and the separated organic phase were washed with 10 % NaHCO<sub>3</sub> (150 mL) and brine (150 mL). The organic phase was dried and evaporated to give 13.1 g of a crude white solid.

Separation of diastereoisomers was achieved by flash chromatography on SiO<sub>2</sub> eluting with a mixture of ethyl acetate/hexane 6/4.

5.32g (30.2 %) of the title compound were obtained as white solid.

Rf: 0.23 (ethyl acetate/hexane 6/4)

2.4 g (8.96 mmol) of Example 10A were dissolved in 30 mL ethanol. At room temperature a solution of 10 mL (120 mmol) hydrogen peroxide (35 % in water) and 50 mL ammonia (25 % in water) was added slowly over a period of 10 min. The reaction mixture was stirred at room temperature for 2h. The solution was carefully concentrated to a volume of 50 mL under reduced pressure. A precipitate formed and was collected by filtration. 1.3 g (50 %) of the product were obtained as a solid.

#### Example 41

80 mg (0.38 mmol) of Example 11B were dissolved in 1 mL of absolute ethanol, 262 mg (1.52 mmol) of ethyl tetrahydropyran-4-yl-acetate, and 45.1 mg (1.10 mmol) of sodium hydride (60 % suspension in mineral oil) were added. The reaction mixture was heated to 150°C for 40 min in a microwave oven. Cooling to 20°C was followed by evaporation of the solvent under reduced pressure. The residue was treated with water (10 mL), acidified with HCl (10 % in water) and extracted two times with dichloromethane (2 mL). The organic layer was dried over sodium sulphate, filtered and the filtrate was concentrated under reduced pressure. The residue was triturated with ether to give 65 mg (53.7 %) of the product as a white solid.

## Example 133

6-(2-Ethyl-butyl)-1-(tetrahydro-pyran-4-yl)-1,5-dihydro-pyrazolo[3,4-d]pyrimidin-4-one

Example 11B (0.1 g, 0.48 mmol) was mixed with polyphosphoric acid (1.0 g) and 2-(trifluoromethoxy)phenylacetic acid (248 mg, 1.9 mmol) was added. The mixture was heated to 120°C during 16 hours. Temperature was lowered to 20°C and the pH value was adjusted to 7 by addition of ammonia (30 % solution in water). The aqueous phase was extracted with dichloromethane (2 x 20 mL) and the organic phase was dried over sodium sulphate. The crude mixture was purified by flash chromatography. Eluent: hexane/ethyl acetate 40/60.

Obtained 23.5 mg (16 %) as a white solid

HPLC-MS (1E) Rt: 6.77 min

106 mg (0.47 mmol) Example 12V was mixed with 4 mL ethyl acetate and 0.5 mL dimethylformamide, 51 mg (0.61 mmol) 3.4-dihydro-2H-pyran and 88.4 mg (0.51 mmol) p-toluenesulfonic acid were added. The reaction mixture was heated to 60°C and stirred for 2h. After cooling to room temperature ethyl acetate was added and the mixture was washed with saturated sodium hydrogen carbonate and with saturated sodium chloride. The organic layer was evaporated under reduced pressure. The residue was purified by preparative HPLC-MS. 31.5 mg (21.7 %) were obtained.

A vial was charged under inert atmosphere with Example 5 (175 mg, 0.45 mmol), pyrazole (306 mg, 4.49 mmol), copper iodide (85 mg, 0.45 mmol) and cesium

carbonate (439 mg, 1.35 mmol) were added. Dimethylformammide (5 ml), previously degassed, was then added, followed by N-N'-dimethylethylenediamine (47.87  $\mu$ l; 0.45 mmol). The reaction mixture was heated to 120 °C for three hours. The suspension was then filtered over a Celite pad; Celite was washed with DMF. The volume of the organic phase was reduced under reduced pressure and, afterwards, ammonium chloride saturated solution was added, followed by ethyl acetate. The phases were separated and the organic phase was washed with brine and then dried. The crude product was purified by SPE cartridge and the product obtained was further purified by SPE Stratosphere "PL-THIOL MP" to completely remove copper salts. The solid obtained was triturated with diethyl ether. 15.5 mg of the desired compound were obtained (yield = 9.2%).

N-Hydroxy-2-[4-oxo-1-(tetrahydro-pyran-4-yl)-4,5-dihydro-1H-pyrazolo[3,4-d]pyrimidin-6-ylmethyl]-benzamidine (120 mg, content 70%; 0.228 mmol) was suspended in trimethylorthoacetate (5 ml) and acetic acid was added afterwards (1 ml); the mixture was heated to 100 °C for one hour. The mixture was cooled at room

temperature and the precipitation of a solid was observed. The filtrate was evaporated under reduced pressure; the crude product was purified by flash chromatography. The product was then triturated with diethyl ether. 24 mg of the desired compound were obtained (yield 26.6%).

HPLC/MS (Method 1E hydro)

MS (ESI pos):  $m/z = 393 (M+H)^{+}$ 

Example 233

Example 12X (250 mg, 1.14 mmol) was dissolved in 20 ml of hot methanol. Alumina (neutral) was added and the solvent was then removed to give a white powder which was transferred into a 2 ml Wheaton vial; 5,6-Dihydro-2H-pyran-2-oxo was added followed by DMFe (1ml) and the vial was closed tightly. The suspension was heated to 80°C with orbital shaking during 4 days. The reaction was then filtered and the alumina was washed with methanol, ethyl acetate and dicholoromethane; the organic solutions were combined and solvents removed under reduced pressure. The crude product was purified by flash chromatography.

Eluent: (gradient starting with n-hexane/ethyl acetate 9/1 to ethyl acetate (100%) followed by ethyl acetate/methanol 99/1 to 94/6). 70 mg of the desired compound were obtained as solid (19.3 %).

HPLC-MS (Method 2F): Rt: 9.06 min

MS (ESI pos):  $m/z = 317 (M+H)^{+}$ 

WO 2009/121919 PCT/EP2009/053907 - 272 -

Example 53 (160 mg, content 80%, 0.38 mmol) and hydrazine hydrate (0.186 ml, 3.81 mmol) were mixed together in absolute ethanol (4 ml) in a 25 ml flask. The reaction mixture was refluxed for 6 hours before being worked up. The solvent was removed under reduced pressure to obtain 200 mg (content 70%, 0.38 mmol) of the desired material used as such in the next step. The material (200mg, 70% content, 0.38 mmol) was suspended in trimethylorthoacetate (6 ml). Acetic acid is added (0.6 ml) and the solution was heated to 80°C for 30 minutes. Trimethylortoacetate and acetic acid were removed under reduced pressure and the crude product was partitioned between water and dichloromethane. The organic phase is dried and the crude product purified by flash chromatography. (gradient: starting with dichloromethane/methanol 98/2 and finishing with dichloromethane/methanol 90/10). The product was further purified by trituration with diethyl ether. 8 mg of the desired compound were obtained (4%).

HPLC-MS (Method 1E hydro): Rt: 6.82 min

MS (ESI pos):  $m/z = 392 (M+H)^{+}$ 

22 mg (0.06 mmol) of example 230-4 in 3 ml methanol were hydrogenated over Pd/C (10 %) under atmospheric pressure. The catalyst was removed. The solvent was evaporated and the residue chromatographed by HPLC (eluent A: water + 0.13 % TFA, eluent B: acetonitrile) to yield 15.7 mg (71 %) of the product.

HPLC-MS (Method 1): Rt: 1.35 min

MS (ESI pos):  $m/z = 369 (M+H)^{+}$ 

### Example 236

100 mg (73 %, 0.251 mmol) of example 40-5 were dissolved in 2 ml acetic acid and 30  $\mu$ L (0.35 mmol) hydrogen peroxide solution in water (35 %) were added. The mixture was stirred for 3 h and acetonitrile/water was added. The mixture was chromatographed by HPLC (eluent A: water + 0.13 % TFA, eluent B: acetonitrile) to yield 50.3 mg (65 %) of the product.

HPLC-MS (Method 1): Rt: 0.88 min

MS (ESI pos):  $m/z = 307 (M+H)^{+}$ 

WO 2009/121919 PCT/EP2009/053907 - 274 -

100 mg (73 %, 0.251 mmol) of example 40-5 were dissolved in 2 ml acetic acid and 200  $\mu$ L (2.33 mmol) hydrogen peroxide solution in water (35 %) were added. The mixture was stirred for 3 days and acetonitrile/water was added. The mixture was chromatographed by HPLC (eluent A: water + 0.13 % TFA, eluent B: acetonitrile) to yield 21.5 mg (27 %) of the product.

HPLC-MS (Method 1): Rt: 0.93 min

MS (ESI pos):  $m/z = 323 (M+H)^{+}$ 

#### **Claims**

1. A compound according to general formula I

with

<u>**Hc**</u> is a mono-, bi- or tricyclic heterocyclyl group, the ring members of which are carbon atoms and at least 1, preferably 1, 2 or 3, heteroatom(s), which are selected from the group of nitrogen, oxygen and sulphur, which is in the form of  $-S(O)_r$  - with r being 0, 1 or 2, and

R<sup>4</sup> and R<sup>5</sup> independently of one another being selected from the group of H-, fluorine, and methyl; preferably independently of one another being selected from the group of H- and fluorine, more preferably R<sup>4</sup> and R<sup>5</sup> both being H;

 ${f R}^{10}$  independently from any other  ${f R}^{10}$  being selected from the group of

 $C_{1-6}$ -alkyl-,  $C_{3-7}$ -cycloalkyl-, aryl and heteroaryl

where the above-mentioned members may optionally be substituted independently of one another by one or more substituents selected from the group consisting of fluorine,  $F_3C_7$ ,  $F_3C_$ 

 $\mathbf{x}$  = 0, 1, 2, 3 or 4, preferably  $\mathbf{x}$  = 0, 1 or 2, preferably  $\mathbf{x}$  = 0 or 1, most preferably  $\mathbf{x}$  = 0;

y = 0, or 1, most preferably y = 0;

and pharmaceutically acceptable salt forms or solvates thereof

with the proviso that

if  $\underline{\textit{Hc}}$  is oxetanyl, which is bound via the carbon atom next to the oxygen of the oxetanyl, there is no substituent attached to said carbon atom via a -CH<sub>2</sub>-spacer.

15. A compound according to claim 13, wherein

<u>**Hc**</u> being selected from the group of tetrahydropyranyl, tetrahydrofuranyl, piperidinyl, pyrrolidinyl;

and

R<sup>2</sup> independently of any other R<sup>2</sup> being selected from the group of H- and C<sub>1-6</sub>-alkyl-,

WO 2009/121919 PCT/EP2009/053907

and in cases  $\mathbf{R}^2$  is attached to a nitrogen which is a ring member of  $\underline{Hc}$ , this  $\mathbf{R}^2$  shall be independently of any other  $\mathbf{R}^2$ : H-,  $C_{1-6}$ -alkyl-CO-,  $C_{1-6}$ -alkyl-O-CO-,  $C_{1-6}$ -alkyl-, phenyl-CO-, phenyl-O-CO-,  $(C_{1-6}$ -alkyl)<sub>2</sub>N-CO-,

where the above-mentioned members may optionally be substituted independently of one another by one or more fluorine substituents;

and

R<sup>4</sup> and R<sup>5</sup> being H

and

 ${f R}^{10}$  independently from any other  ${f R}^{10}$  being selected from the group of  $C_{1-6}$ -alkyl-, phenyl, and pyridyl

where the above-mentioned members may optionally be substituted independently of one another by one or more substituents selected from the group consisting of fluorine,  $F_3C_7$ ,  $F_3C_$ 

16. A compound according to claim 15, wherein

<u>**Hc**</u> being selected from the group of tetrahydropyranyl, tetrahydrofuranyl, piperidinyl, pyrrolidinyl;

and

 $\boldsymbol{R}^{\boldsymbol{1}}$  being selected from the group of

phenyl, 2-, 3- and 4-pyridyl, pyrimidinyl, pyrazolyl, thiazolyl, cyclopropyl, cyclobutyl, cyclopentyl, cyclopentyl, cyclopentyl, ethyl, propyl, 1-and 2-butyl-, 1-, 2- and 3-pentyl-, tetrahydrofuranyl and tetrahydropyranyl,

where these groups may optionally be substituted by one or more substituents selected from the group consisting of HO-, NC-,  $C_{1-6}$ -alkyl-O-,  $C_{1-6}$ -alkyl-O-,  $C_{3-6}$ -alkyl-O-,  $C_{3-7}$ -cycloalkyl- $C_{1-3}$ -alkyl-O-,  $C_{3-7}$ -heterocycloalkyl- and  $C_{3-7}$ -heterocycloalkyl- $C_{1-6}$ -alkyl-.

 $R^2$  independently of any other  $R^2$  being selected from the group of H- and  $C_{1-6}$ -alkyl-, and in cases  $R^2$  is attached to a nitrogen which is a ring member of  $\underline{Hc}$ , this  $R^2$  shall be independently of any other  $R^2$ : H-,  $C_{1-6}$ -alkyl-CO-,  $C_{1-6}$ -alkyl-O-CO-,  $C_{1-6}$ -alkyl-,

where the above-mentioned members may optionally be substituted independently of

and

R<sup>3</sup> independently of any other R<sup>3</sup> being selected from the group of

phenyl-CO-, phenyl-O-CO-, (C<sub>1-6</sub>-alkyl)<sub>2</sub>N-CO-,

one another by one or more fluorine substituents;

H-, hydroxy and  $C_{1-6}$ -alkyl-O-, whereby  $C_{1-6}$ -alkyl-O- may optionally be substituted by one or more fluorine, chlorine, bromine and HO-; preferably  $\mathbb{R}^3$  being H-;

and

R<sup>4</sup> and R<sup>5</sup> being H

and

 $\mathbf{x} = 0$ , 1, 2, 3 or 4, preferably  $\mathbf{x} = 0$ , 1 or 2, preferably  $\mathbf{x} = 0$  or 1, most preferably  $\mathbf{x} = 0$ ;

y = 0, or 1, most preferably y = 0;

and pharmaceutically acceptable salt forms or solvates thereof.

17. A compound according to claim 1, wherein

<u>**Hc**</u> being selected from the group of tetrahydropyranyl, tetrahydrofuranyl, piperidinyl, pyrrolidinyl;

and

R<sup>1</sup> being selected from the group of

phenyl, 2-, 3- and 4-pyridyl-, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, cyclopentylmethyl, ethyl, propyl, 1- and 2-butyl-, 1-, 2- and 3-pentyl-, tetrahydrofuranyl, and tetrahydropyranyl,

where these groups may optionally be substituted by one or more substituents selected from the group consisting of NC-, C<sub>1-6</sub>-alkyl-O-, C<sub>1-6</sub>-alkyl-, CF<sub>3</sub>O-, CF<sub>3</sub>- and halogen, the halogen preferably being selected from the group of fluorine, chlorine and bromine.

 $R^2$  independently of any other  $R^2$  being selected from the group of H- and  $C_{1-6}$ -alkyl-, and in cases  $R^2$  is attached to a nitrogen which is a ring member of  $\underline{Hc}$ , this  $R^2$  shall be independently of any other  $R^2$ : H-,  $C_{1-6}$ -alkyl-CO-,  $C_{1-6}$ -alkyl-O-CO-,  $C_{1-6}$ -alkyl-,

where the above-mentioned members may optionally be substituted independently of one another by one or more fluorine substituents;

and

 ${f R}^3$  independently of any other  ${f R}^3$  being selected from the group of

phenyl-CO-, phenyl-O-CO-, (C<sub>1-6</sub>-alkyl)<sub>2</sub>N-CO-,

H-, hydroxy and  $C_{1-6}$ -alkyl-O-, whereby  $C_{1-6}$ -alkyl-O- may optionally be substituted by one or more fluorine, chlorine, bromine and HO-; preferably  ${\bf R}^3$  being H-;

and

R<sup>4</sup> and R<sup>5</sup> being H

and

 $\mathbf{x}$  = 0, 1, 2, 3 or 4, preferably  $\mathbf{x}$  = 0, 1 or 2, preferably  $\mathbf{x}$  = 0 or 1, most preferably  $\mathbf{x}$  = 0;

y = 0, or 1, most preferably y = 0;

and pharmaceutically acceptable salt forms or solvates thereof.

18. A compound according to claim 1 characterised in that the compound is selected from the group of

15

and the stereoisomeres of each thereof or tautomeres of each thereof or solvates of each thereof or pharmaceutically acceptable salts of each thereof.

- 19. A compound according to any of claims 1 to 18 as a medicament, preferably as a medicament for the treatment of a CNS disease, more preferably as a medicament for the treatment of a CNS disease, the treatment of which is accessible by the inhibition of PDE9.
- 20. Use of a compound according to claims 1 to 18 for the manufacture of a medicament for the treatment of a disease that is accessible by the inhibition of PDE9.
  - 21. Use of a compound according to any of claims 1 to 18 for the manufacture of medicament for the treatment, amelioration or prevention of cognitive impairment being related to perception, concentration, cognition, learning or memory.
- 22. Use according to claim 21, characterised in that the medicament is for the treatment, amelioration or prevention of cognitive impairment being related to age-associated learning and memory impairments, age-associated memory losses, vascular dementia, craniocerebral trauma, stroke, dementia occurring after strokes (post stroke dementia), post-traumatic dementia, general concentration impairments, concentration impairments in children with learning and memory problems, Alzheimer's disease, Lewy body dementia, dementia with degeneration of the frontal

lobes, including Pick's syndrome, Parkinson's disease, progressive nuclear palsy, dementia with corticobasal degeneration, amyotropic lateral sclerosis (ALS), Huntington's disease, multiple sclerosis, thalamic degeneration, Creutzfeld-Jacob dementia, HIV dementia, schizophrenia with dementia or Korsakoff's psychosis.

5

- 23. Use of a compound according to any of claims 1 to 18 for the manufacture of medicament for the treatment of Alzheimer's disease.
- 24. Use of a compound according to any of claims 1 to 18 for the manufacture of medicament for the treatment of cognitive impairment which is due to Alzheimer's disease.
  - 25. Use of a compound according to any of claims 1 to 18 for the manufacture of medicament for the treatment of sleep disorders, bipolar disorder, metabolic syndrome, obesity, diabetis mellitus, hyperglycemia, dyslipidemia, impaired glucose tolerance, or a disease of the testes, brain, small intestine, skeletal muscle, heart, lung, thymus or spleen.
  - 26. Pharmaceutical composition comprising a compound according to any of claims 1 to 18 and a pharmaceutical carrier.

20

15

- 27. Method for the treatment of a condition as defined in any of claims 19 to 25 in a patient comprising administering to said patient a therapeutically active amount of a compound according to any of claims 1 to 18.
- 25 28. Combination of a compound according to any of claims 1 to 18 with another active agent for the treatment of Alzheimer's disease.
